

How to use UCL HPC

Basic information on using High Performance Computing

Ph.D. student: Doy Kwon
doy.kwon.19@ucl.ac.uk
07946 599 645

Presenter

1. Doy Kwon (Chief Inspector)

2. Main arena of work

- Crime prevention and security
- Crime data science
- Anti-crime policy making

3. History

03-10, in the field, patrol officer, detective, traffic, etc.

11-14, KNPA, Community Safety Bureau

14-'19, Lecturer in Police HRD Institute

19-, PhD student, Security and Crime Science in UCL

Prime Minister Awards in 'The 33rd Public HRD Contest' held at
National Human Resources Development Institute in 2015

Demos

CHAPTER 01

Overview

● Before, start a presentation

■ All information is in the websites below.

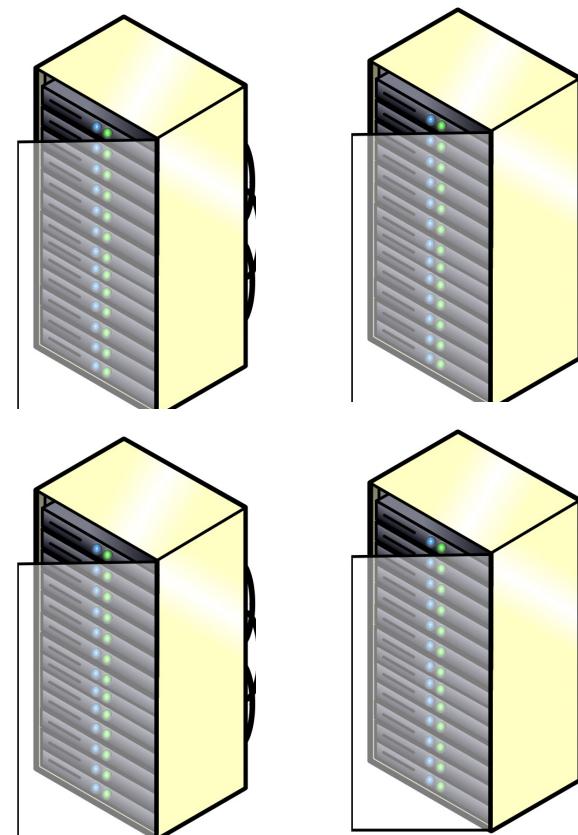

- (1) <https://www.rc.ucl.ac.uk/docs/> UCL Research Computing Documentation
- (2) <http://rits.github-pages.ucl.ac.uk/hpc-intro/aio/index.html> Introduction to HPC
- (3) <https://www.ucl.ac.uk/isd/services/research-it/research-computing-platforms-service>
UCL Research Computing Platforms Service
- (4) <https://www.rc.ucl.ac.uk/docs/Interactive%20Jobs/> About using HPC interactively
- (5) <https://www.ucl.ac.uk/isd/services/get-connected/ucl-virtual-private-network-vpn/>
UCL VPN

● What is High Performance Computing?

- People call it as “Server”, “Cluster”, and “Super-computer”.
- Anyway, HPC is bundles of computers out there to calculate large and complex data

VS

● Why do I use HPC?

- Large memory : up to 1.5Tb RAM for single core
- Multicore : You can use over 128 cores at once (if you can code...)
- Save your resources : electricity, time, computer...
- You can run several codes simultaneously as if you have several computers at home
 - (1) While you run codes in R on your laptop, you can not use R anymore for other job
 - (2) But! You can run several R codes simultaneously with HPC.

● Differences of HPC compared to Personal com.

■ Basic command language is different : UNIX Shell (Linux)

- (1) Not based on GUI system such as Mac and Window. You should write codes in line like DOS program
- (2) You can use R, Python or Matlab, but can't use Rstudio and Anaconda in HPC

■ You should submit a scheduling job script

- (1) According to the resources that you request, your job will be scheduled by the system organizer ("scheduler") automatically

■ The versions of software is a little bit old for maintaining stability

- (1) Recent version of R is 4.0.3, but the version of R in HPC is 3.6.0

■ Interactive mode can be tested with limited resources

- (1) We can use R interactively in HPC, but only for 2hours with 512mb RAM

■ Basically, you can use only 150Gb for a storage in the server

CHAPTER 02

Accessing HPC

● You should get a permission to access HPC.

■ Write Application form

<https://www.ucl.ac.uk/isd/services/research-it/research-computing-platforms-service>

How to apply to use the research computing platforms

We provide access to three computing clusters: Myriad, Grace and Kathleen ([What is a computing cluster?](#)). All UCL researchers are eligible to use these platforms on a fair share basis and at no cost. We have a single application process for all of our research computing platforms - see the [account services](#) guide for details.

To obtain an account you must either be, or be sponsored by, a permanent member of staff. If you are a student or a postdoctoral researcher, this will normally be your supervisor.

You will need your UCL userid and password to access the application form.

[Application form](#)

■ The process of authorization

- (1) You write these info in the application form : previous experience of using HPC, research project details, work descriptions, required resources, etc.
- (2) **Your supervisor** will get email from RC-support team to approve your access using HPC.
- (3) After permission, you will get a specific server name that is proper to your job by email.

● Choose “Resources required” in the form

■ There are several HPC servers in UCL

- (1) According to the “resources required” selection, you will be allocated specific server that fits for your work.

Resources required

Currently approved services: Myriad

Types of resource needed:

- Individual single core jobs
- Large numbers (>1000) of single core jobs
- Multithreaded jobs
- Extremely large quantities of RAM (>64GB)
- Small MPI jobs (<40 cores)
- Medium-sized MPI jobs (80-320 cores)
- Large-sized MPI jobs (>320 cores)
- At least one GPGPU
- At least ten GPGPUs

■ My work uses lots of memories than CPUs, so I chose like this.

■ So, server named “Myriad” were allocated to me.

● How to login the Myriad server

■ Now you want to connect to the remote server with your laptop

- (1) Secure Shell Protocol (SSH) https://en.wikipedia.org/wiki/Secure_Shell_Protocol
- (2) Just remember “ssh” is a command that connects your laptop to the server

■ Turn on your “terminal (Mac)” or “remote desktop connection (Win)”

- (1) When you are in UCL, you can connect the server directly.
- (2) However!!! If you are out of UCL firewall, at home, you should connect to “Socrates” VPN first for security matters
- (3) After log into Socrates, you can connect to the HPC server

■ Connect to Myriad server with “ssh” command at home

>ssh ucl_id@socrates.ucl.ac.uk

→ You should write your password

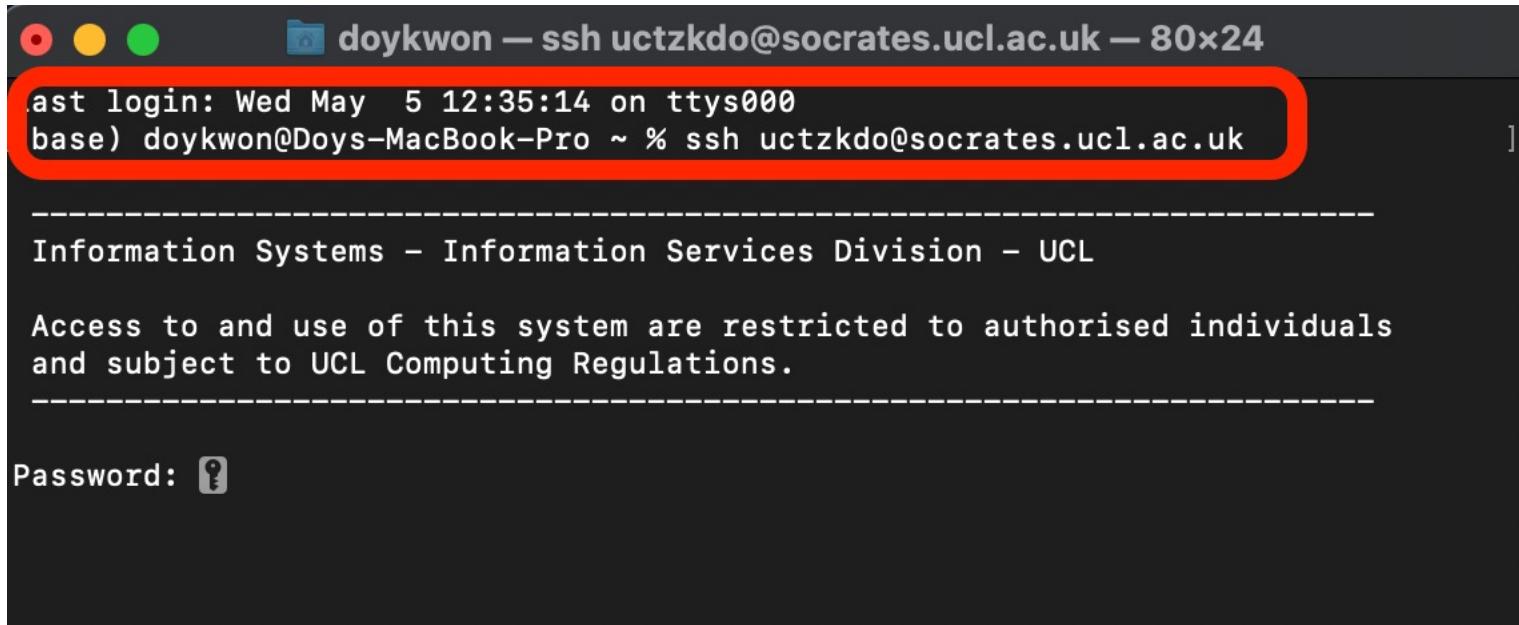

>ssh ucl_id@myriad.rc.ucl.ac.uk

→ You should write your password

● Connect to Socrates VPN first 1

■ In your Mac, write codes below in terminal

> ssh userid@socrates.ucl.ac.uk

The screenshot shows a terminal window titled "doykwon — ssh uctzkdo@socrates.ucl.ac.uk — 80x24". The window contains the following text:

```
ast login: Wed May  5 12:35:14 on ttys000
base) doykwon@Doys-MacBook-Pro ~ % ssh uctzkdo@socrates.ucl.ac.uk
```

Below this, there is a dashed line followed by the text:

Information Systems - Information Services Division - UCL
Access to and use of this system are restricted to authorised individuals
and subject to UCL Computing Regulations.

At the bottom, it says "Password: " followed by a key icon.

```
[base) doykwon@Doys-MacBook-Pro ~ % ssh uctzkdo@socrates.ucl.ac.uk
```

```
-----  
Information Systems - Information Services Division - UCL
```

```
Access to and use of this system are restricted to authorised individuals  
and subject to UCL Computing Regulations.  
-----
```

```
Password:
```

```
Last login: Wed May 5 12:41:52 2021 from ra-vpn179.ra-vpn.ucl.ac.uk
```

```
--- This machine is managed by Puppet 6 ---
```

```
Information Services Division - UCL
```

```
Access to and use of this system are restricted to authorised individuals  
and subject to UCL Computing Regulations.
```

```
All IS systems run unattended overnight and at weekends.  
If they fail services may not be restored until the next working day.
```

```
ISD Service Desk Hours
```

```
Monday to Friday - 08.30 - 17.30 (Telephone Support)  
Monday to Friday - 09.30 - 17.00 (Personal Callers)
```

```
Vacation times will vary
```

```
For ISD Service Desk contact information, see www.ucl.ac.uk/isd/servicedesk  
For Service News, see www.ucl.ac.uk/isd/news
```

```
Please report any service issues to the ISD Service Desk.
```

```
PLEASE NOTE- Files in the /tmp file system are deleted at regular intervals.  
Please ensure that any important files are stored in your home directory.
```

```
5 %
```

> ssh userid@myriad.rc.ucl.ac.uk

```
PLEASE NOTE- Files in the /tmp file system are deleted at regular intervals.  
Please ensure that any important files are stored in your home directory.  
-----
```

```
5 % ssh uctzkdo@myriad.rc.ucl.ac.uk
```

```
Password:
```

● Then, connect to the specific HPC server

```
5 % ssh uctzkdo@myriad.rc.ucl.ac.uk  
Password:  
Last login: Tue Apr 27 12:38:20 2021 from socrates-a-d05.isdapp.ucl.ac.uk  
[ucl_myriad]
```

Research IT Services

```
~/  
* is backed up  
* has a 150GB quota limit
```

```
~/Scratch  
* is NOT backed up  
* should be considered "at risk"  
* has a 1TB quota limit (by default)
```

To request quota increases, and other support, contact:
rc-support@ucl.ac.uk

Access to and use of this system are restricted to authorised individuals and subject to UCL Computing Regulations.

https://www.ucl.ac.uk/information-security/sites/information-security/files/Regulations_0.pdf

In particular, please note that this service should not be used to store data for which you have obligations under the Data Protection Act 2018:

<https://www.ucl.ac.uk/legal-services/data-protection-overview>

For datasets obtained under contract, please ensure you are complying with contractual requirements.

Myriad announcements mailing list:
myriad-users@ucl.ac.uk

Help and Support Pages:
https://wiki.rc.ucl.ac.uk/wiki/Category:User_Guide

```
[uctzkdo@login12 ~]$ []
```

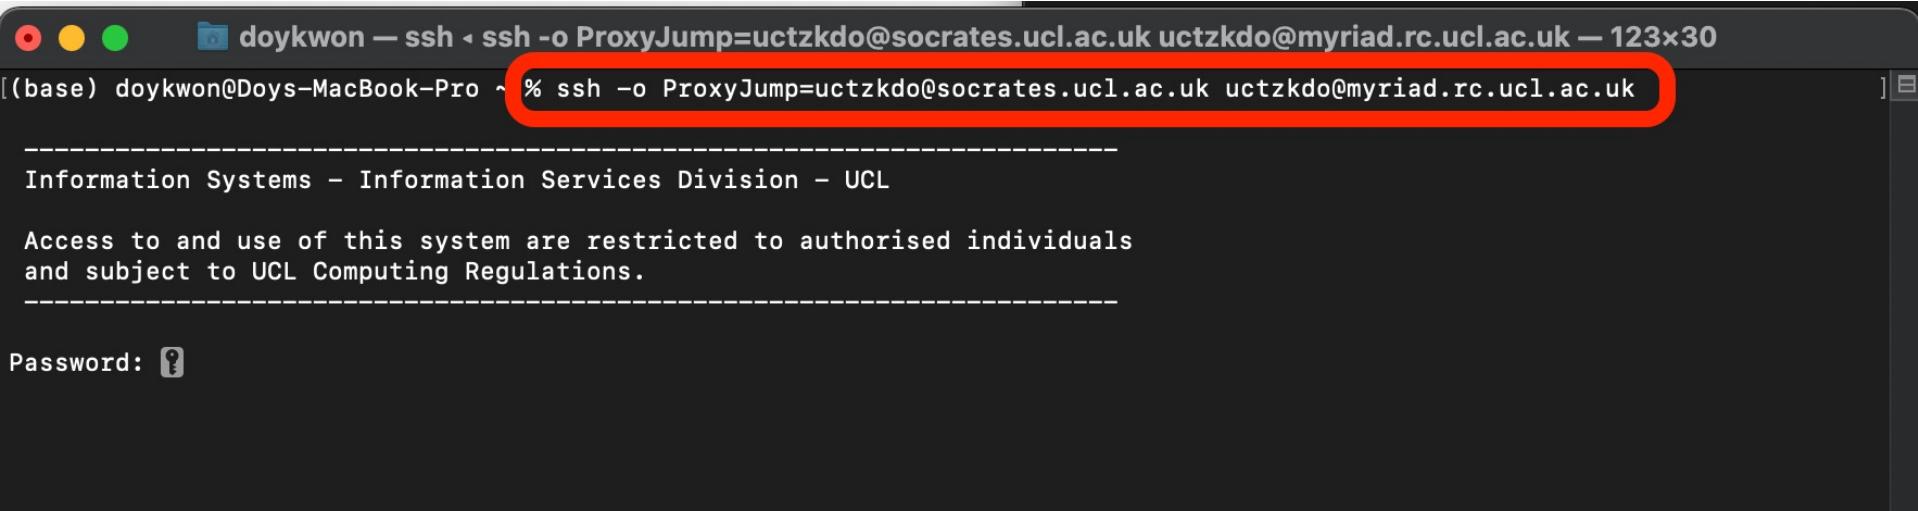

● More easy way of logging to HPC by tunnelling

■ Instead, you can log in with one line of code by tunnelling

(1) On your laptop “terminal”, write code below

```
> ssh -o ProxyJump=uctzid@socrates.ucl.ac.uk uctzid@myriad.rc.ucl.ac.uk
```

you should write your ucl-id in “uctzid” above

A screenshot of a macOS terminal window. The title bar says "doykwon — ssh -o ProxyJump=uctzkdo@socrates.ucl.ac.uk uctzkdo@myriad.rc.ucl.ac.uk — 123x30". The command line shows the user typing "% ssh -o ProxyJump=uctzkdo@socrates.ucl.ac.uk uctzkdo@myriad.rc.ucl.ac.uk". This typed command is highlighted with a red oval. Below the terminal window, there is a watermark or footer text: "Information Systems - Information Services Division - UCL" and "Access to and use of this system are restricted to authorised individuals and subject to UCL Computing Regulations." At the bottom left of the terminal window, it says "Password: " followed by a password field icon.

■ After input passwords two times, you can log into HPC.

CHAPTER 03

Basic commands

● UNIX Shell (Linux) basic commands

- After logging on the server, you can input commands interactively.
- Here are basic commands that you will use on someday.

No.	Command	Meaning	Usage
1	pwd	Path of this working directory	>pwd
2	ls	List the files and directories	> ls -l
3	cd	Change directory	> cd ..
4	cat	Concatenate. Make new txt file / show file contents	>cat file.txt
5	cp	Copy file or directory	>cp A B
6	mv	Move file	>mv A B
7	mkdir / rmdir	Make directory Remove directory	>mkdir name
8	rm	Remove file or directory	>rm file.name
9	*	all	>rm *.zip
10	nano	Open and edit file	>nano file.name

● UNIX Shell (Linux) basic commands

```
[[uctzkdo@login12 ~]$ pwd  
/home/uctzkdo  
[[uctzkdo@login12 ~]$ ls -l  
total 12  
drwxr-xr-x 3 uctzkdo uctzp0 4096 Apr 13 17:11 R  
lrwxrwxrwx 1 uctzkdo uctzp0 24 Feb 2 22:56 Scratch -> /scratch/scratch/uctzkdo  
drwxr-xr-x 3 uctzkdo uctzp0 4096 Apr 15 09:30 data  
drwxr-xr-x 2 uctzkdo uctzp0 4096 Mar 2 15:55 temp  
[uctzkdo@login12 ~]$
```

Google “linux server basic commands” for more understanding

<https://www.hostinger.com/tutorials/linux-commands>

● How can I transfer files in and out of HPC

- If you are at home, outside of UCL firewall, you should use UCL VPN
- Without using UCL VPN, you cannot transfer files in and out of HPC

<https://www.ucl.ac.uk/isd/services/get-connected/ucl-virtual-private-network-vpn/>

- (1) Super easy, just go to the website, and choose proper file for your O/S
- (2) You should install "Cisco AnyConnect Secure Mobility Client"

Installing the Cisco AnyConnect Secure Mobility Client

Please note: You are installing the application onto your machine/device and configuring the client entirely at your own risk and no guarantees can be made that they will work.

Click and download

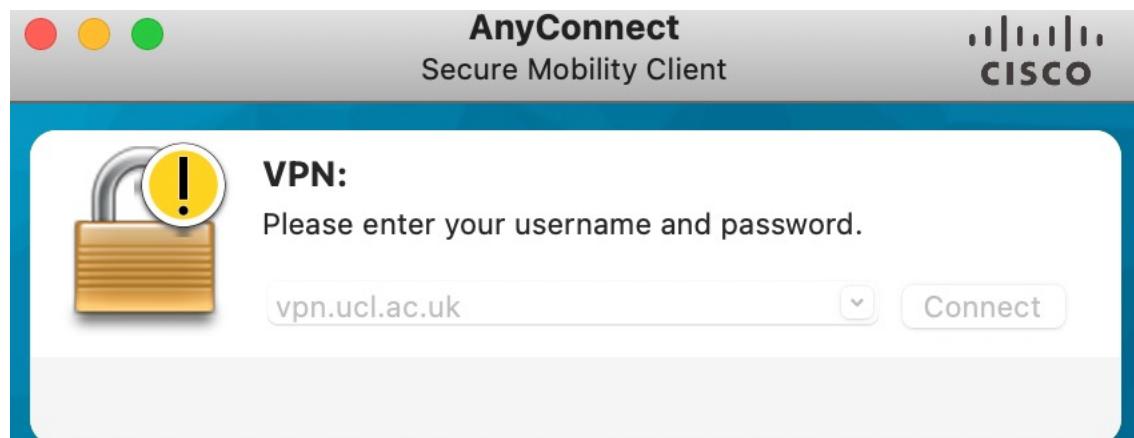

1. Download the [Cisco AnyConnect Secure Mobility Client](#) installation file (your UCL user ID and password may be required)
2. When prompted, choose [Open with](#) or [Save File](#) (options depend on which web browser you are using)
3. If the installation file does not mount automatically, open the file from the location it was saved and double-click to mount
4. Double-click the **AnyConnect.pkg** file to begin the installation process (Fig.1)

● Codes for transferring file from laptop to HPC

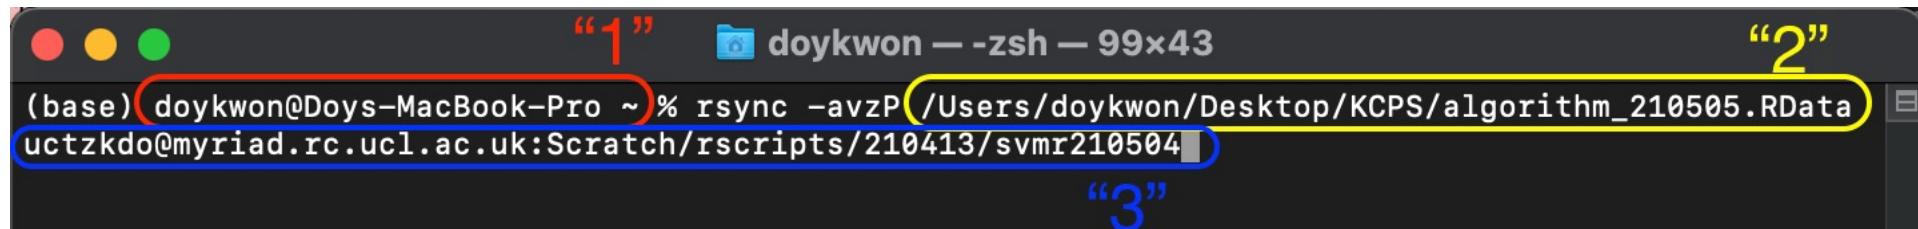

- After log into UCL VPN (Cisco app), you can transfer file remotely in and out of HPC

> `rsync -avzP local/path/folder/file.csv uctzid@myriad.rc.ucl.ac.uk:target/directory`

- (1) Now, you want to move a file in your laptop to HPC.
- (2) So, you should input your codes in laptop terminal not HPC terminal (you can turn on several terminals at the same time)
- (3) Parameters : a (archive), v (verbose), z (compression), P (partial/progress)

● Codes for transferring a file from laptop to HPC

```
(base) [doykwon@Doys-MacBook-Pro ~] % rsync -avzP /Users/doykwon/Desktop/KCPS/algorithm_210505.RData  
uctzkdo@myriad.rc.ucl.ac.uk:Scratch/rscripts/210413/svmr210504
```

- (1) "1" : you should write codes on your laptop terminal.
- (2) "2" : Local path of file
- (3) "3" : Target directory in HPC where the file will transfer
- (4) You can transfer many file by making archive file (zip, tar... commands)

```
> rsync -avzP local/path/folder/file.csv uctzid@myriad.rc.ucl.ac.uk:target/directory
```

● Codes for transferring a file from HPC to laptop

```
doykwon — -zsh — 110x43
(base) doykwon@Doys-MacBook-Pro ~ % scp uctzkdo@myriad.rc.ucl.ac.uk:Scratch/rscripts/210413/final_2020_2_3.zip
/Users/doykwon/Desktop/KCPS/2020_data
```

- (1) You want to get a file from HPC to your laptop
- (2) You should write codes on your laptop terminal.
- (3) Write directory and file name in HPC first and then write local path
- (4) "scp" commands also conduct file transferring, but "rsync" is much faster

➤ `rsync -avzP uctzid@myriad.rc.ucl.ac.uk:directory/file.csv local/path/folder`

➤ `scp uctzid@myriad.rc.ucl.ac.uk:directory/file.csv local/path/folder`

CHAPTER 04

Run your R codes in HPC

● Job script file? Batch job?

- In HPC server, you should make and submit a job script file for each task.
- HPC scheduler program will read your job script file and consider where to put the job on the nodes according to the size of requested resources.
- This process is called batch job submission.

Job script file is ending with "file.sh"

- Requesting resources : memory, CPU cores, processing time
- Running batch file
- https://www.rc.ucl.ac.uk/docs/Software_Guides/R/ examples of R job script file

So, you need to have two files for a task in HPC.

One is "Job script file" and "Code file" that you want to run.

● Nano editor

- When you make code files including batch, R, python, etc, you will use nano editor commands in HPC.

No.	Command	Meaning	Usage
1	nano	Open the file	>nano batch.R
2	Ctrl + o	Save the file	
3	Ctrl + x	Exit nano editor	

- # : when you start the code with # (Hash), it means comments, so the program ignore the line after #.

● My real Job script code for R

```
● doykwon — uctzkdo@login12:~/Scratch/rscripts/210413 — ssh uctzkdo@  
GNU nano 2.4.2 File: b.sh  
  
# Test job script for R in HPC  
#!/bin/bash -l 1  
  
# Request 48hours of wall clock time (You can request under 72 hours only)  
#$ -l h_rt=48:00:00 2  
  
# Request 1300GB RAM (You can request under 1500GB)  
#$ -l mem=1300G 3  
  
# set the name of jobs  
#$ -N test 4  
  
# set the working directory (R code file should be in this directory)  
#$ -wd /home/uctzkdo/Scratch/rscripts 5  
  
# your work must be done in $TMPDIR (temporary directory set by HPC)  
cd $TMPDIR 6  
  
# Load R module  
module unload compilers 7  
module unload mpi  
module load r/recommended  
  
# run R codes file named test.R and record the result in file "test.out"  
R --no-save < /home/uctzkdo/Scratch/rscripts/test.R > test.out 8  
  
# preferably, tar-up  
tar zcvf $HOME/Scratch/rscripts/test$JOB_ID.tgz $TMPDIR  
  
# done
```

>cat batch.sh
>nano batch.sh

1: Hash Bang (compulsory)

2: Request time

3: Request RAM

4: set the name of job

5: Set WD

6: Just do it (compulsory)

7: load software R

8: Set the location of R code file (VIP)

● My real R code for HPC

GNU nano 2.4.2

File: r_algo_svmr_210505.R

```
# HPC scripts for building Kernel Support Vector Machine classifier for cybercrime with KCPS dataset
options(java.parameters="-Xmx8g")

library(rJava)
library(NLP)
library(NLP4kec) # This package is for morphology analysis of Korean, based on rJava
library(data.table)
library(dplyr)
library(lubridate)
library(tidyverse)
library(stringi)
library(stringr)
library(ggplot2)
library(tm)
library(tidymodels)■
library(chron)
library(magrittr)
library(RTextTools)
library(gmodels)
library(e1071)
library(caret)
library(readxl)

setwd("/lustre/home/uctzkdo/Scratch/rscripts/210413/svmr210504")

load("algorithm_210505.RData")

cf_svmr <- train(form = labels ~., data = training_set_svm2, method = 'svmRadial')

saveRDS(cf_svmr, "cf_SVMR_0505.rds")

predict_svmr <- predict(cf_svmr, test_set_svm)

save.image("algorithm_210507.RData")

# END
```

>cat file.R

>nano file.R

- Just R script
- Load libraries
- Set working directory
- Build codes for my task

● Submit my job and check the situation

■ Submission my job

> qsub batchfile.sh

■ Check the situation of my job once

> qstat

■ Check the situation of my job constantly

> watch -n 30 –u uctzid

■ Killing (withdrawal) my job

> qdel job-number

● Submit my job and check the situation

```
doykwon — uctzkdo@login12:~/Scratch/rscripts/210314 — ssh ▾ ssh -o ProxyJump=uctzkdo@socrates.ucl.ac.uk uctzkdo
every 15.0s: qstat -u uctzkdo                                         Sun Mar 21 21:22
job-ID  prior   name          user         state submit/start at    queue      slots ja-task-ID
-----+-----+-----+-----+-----+-----+-----+-----+-----+
5996724 2.75000 algo_svm3  uctzkdo      r     03/20/2021 09:50:17 Bran@node-b00a-002      1
600131  2.75000 algo_svmr_ uctzkdo      r     03/21/2021 02:33:58 Bran@node-b00a-008      1
606003  2.29108 nb1        uctzkdo      qw    03/21/2021 21:09:54                  1
606010  2.21831 algo_nb1  uctzkdo      qw    03/21/2021 21:15:56                  1
```

■ Watch the job situation constantly every 15 sec.

Name : the job name you wrote in batch file (job submission file)

State : the state of each job

- **r = running**
- **qw = queuing**
- **Eqw = Error** → you should fix codes in batch file
- dr = this job is being deleted
- Rr = this job was rescheduled but is now running on a new node (rare)

● Using R interactively in HPC

- When you install R packages or test your code, you can use R interactively in HPC
- But, the resources are limited (512mb RAM, 2hours).

Just type these 4 lines in your HPC terminal

```
> module unload compilers  
> module unload mpi  
> module load r/recommended  
> R --interactive
```

You can use R interactively. (not like Rstudio, just "R")

CHAPTER 05

Demos for using HPC

Question & Discussion
